

2628. JSON Deep Equal Premium

Medium Companies Hint

Given two values `o1` and `o2`, return a boolean value indicating whether two values, `o1` and `o2`, are **deeply equal**.

For two values to be **deeply equal**, the following conditions must be met:

- If both values are primitive types, they are **deeply equal** if they pass the `===` equality check.
- If both values are arrays, they are **deeply equal** if they have the same elements in the same order, and each element is also **deeply equal** according to these conditions.
- If both values are objects, they are **deeply equal** if they have the same keys, and the associated values for each key are also **deeply equal** according to these conditions.

You may assume both values are the output of `JSON.parse`. In other words, they are valid JSON.

Please solve it without using lodash's `_.isEqual()` function

Example 1:

Input: `o1 = {"x":1,"y":2}, o2 = {"x":1,"y":2}`
Output: `true`
Explanation: The keys and values match exactly.

Example 2:

Input: `o1 = {"y":2,"x":1}, o2 = {"x":1,"y":2}`
Output: `true`
Explanation: Although the keys are in a different order, they still match exactly.

Example 3:

Input: `o1 = {"x":null,"L":[1,2,3]}, o2 = {"x":null,"L":["1","2","3"]}`
Output: `false`
Explanation: The array of numbers is different from the array of strings.

Example 4:

Input: `o1 = true, o2 = false`
Output: `false`
Explanation: `true !== false`

Constraints:

- `1 <= JSON.stringify(o1).length <= 105`
- `1 <= JSON.stringify(o2).length <= 105`
- `maxNestingDepth <= 1000`

Hint 1

You can check if a value is an array with the `Array.isArray()` method. You can check if a value is an object by saying `typeof obj === 'object' && obj !== null`. You can list the keys of an object with the `Object.keys()` function.

Hint 2

If two objects have different keys or two arrays have a different length, they cannot be equal.

Hint 3

You can use recursion to investigate if the values of an object or array are also deeply equal. The base case is when the values are primitives (string, number, etc), at which case the check is a trivial `===` check.
