Given two strings `s` and `t`, return `true` if they are both one edit distance apart, otherwise return `false`.

A string `s` is said to be one distance apart from a string `t` if you can:

- Insert **exactly one** character into `s` to get `t`.
- Delete **exactly one** character from `s` to get `t`.
- Replace **exactly one** character of `s` with a **different character** to get `t`.

Example 1:

Input: `s = "ab", t = "acb"`

Output: `true`

Explanation: We can insert 'c' into `s` to get `t`.

Example 2:

Input: `s = "", t = ""`

Output: `false`

Explanation: We cannot get `t` from `s` by only one step.

Constraints:

- `0 <= s.length, t.length <= 104`
- `s` and `t` consist of lowercase letters, uppercase letters, and digits.
