Given an `m x n` `picture` consisting of black `'B'` and white `'W'` pixels, return *the number of **black** lonely pixels*.

A black lonely pixel is a character `'B'` that located at a specific position where the same row and same column don't have **any other** black pixels.

Example 1:

W	W	B
W	B	W
B	W	W

Input: `picture = [["W","W","B"], ["W","B","W"], ["B","W","W"]]`
Output: `3`
Explanation: All the three 'B's are black lonely pixels.

Example 2:

B	B	B
B	B	W
B	B	B

Input: `picture = [["B","B","B"], ["B","B","W"], ["B","B","B"]]`
Output: `0`

Constraints:

- `m == picture.length`
- `n == picture[i].length`
- `1 <= m, n <= 500`
- `picture[i][j]` is `'W'` or `'B'`.
