## 428. Serialize and Deserialize N-ary Tree Premium

Serialization is the process of converting a data structure or object into a sequence of bits so that it can be stored in a file or memory buffer, or transmitted across a network connection link to be reconstructed later in the same or another computer environment.

which each node has no more than N children. There is no restriction on how your serialization/deserialization algorithm should work. You just need to ensure that an N-ary tree can be serialized to a string and this string can be deserialized to the original tree structure. For example, you may serialize the following 3-ary tree

Design an algorithm to serialize and deserialize an N-ary tree. An N-ary tree is a rooted tree in

Or you can follow LeetCode's level order traversal serialization format, where each group of

1

children is separated by the null value.

```
You do not necessarily need to follow the above-suggested formats, there are many more
different formats that work so please be creative and come up with different approaches
```

Example 1:

## 2,null,13,null,null,14] Output:

Input: root =

yourself.

```
2, null, 13, null, null, 14]
Example 2:
  Input: root = [1,null,3,2,4,null,5,6]
```

[1,null,2,3,4,5,null,null,6,7,null,8,null,9,10,null,null,11,null,1

[1,null,2,3,4,5,null,null,6,7,null,8,null,9,10,null,null,11,null,1

## Example 3:

Input: root = []

0 <= Node.val <= 10<sup>4</sup>

algorithms should be stateless.

```
Output: []
```

Output: [1,null,3,2,4,null,5,6]

## The height of the n-ary tree is less than or equal to 1000

No

Yes

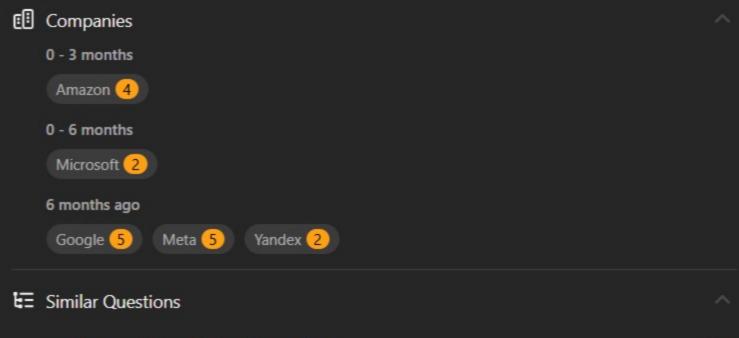

Constraints:

The number of nodes in the tree is in the range [0, 10<sup>4</sup>].

Seen this question in a real interview before? 1/5

Do not use class member/global/static variables to store states. Your encode and decode
