                                Given a list of the scores of different students, items, where items [i] = [ID_i, score_i] represents one score from a
student with ID<sub>1</sub>, calculate each student's top five average.
Return the answer as an array of pairs result, where result[j] = [ID_j, topFiveAverage<sub>j</sub>] represents the student
with ID; and their top five average. Sort result by ID; in increasing order.
A student's top five average is calculated by taking the sum of their top five scores and dividing it by [5] using integer
division.
Example 1:
  Input: items = [[1,91],[1,92],[2,93],[2,97],[1,60],[2,77],[1,65],[1,87],[1,100],
  [2,100],[2,76]]
  Output: [[1,87],[2,88]]
  Explanation:
  The student with ID = 1 got scores 91, 92, 60, 65, 87, and 100. Their top five
  average is (100 + 92 + 91 + 87 + 65) / 5 = 87.
  The student with ID = 2 got scores 93, 97, 77, 100, and 76. Their top five average is
  (100 + 97 + 93 + 77 + 76) / 5 = 88.6, but with integer division their average
  converts to 88.
Example 2:
  Input: items = [[1,100],[7,100],[1,100],[7,100],[1,100],[7,100],[1,100],[7,100],
  [1,100],[7,100]]
  Output: [[1,100],[7,100]]
Constraints:
• 1 <= items.length <= 1000
items[i].length == 2
• 1 <= ID<sub>i</sub> <= 1000

    0 <= score<sub>i</sub> <= 100</li>

    For each ID<sub>i</sub>, there will be at least five scores.

   Hint 1
    How can we solve the problem if we have just one student?
   Hint 2
    Given an student sort their grades and get the top 5 average.
   Hint 3
    Generalize the idea to do it for many students.
