1891. Cutting Ribbons Premium

Medium 🏷 Topics 📑 Companies 💡 Hint

You are given an integer array `ribbons`, where `ribbons[i]` represents the length of the ith ribbon, and an integer `k`. You may cut any of the ribbons into any number of segments of **positive integer** lengths, or perform no cuts at all.

- For example, if you have a ribbon of length `4`, you can:
  - Keep the ribbon of length `4`,
  - Cut it into one ribbon of length `3` and one ribbon of length `1`,
  - Cut it into two ribbons of length `2`,
  - Cut it into one ribbon of length `2` and two ribbons of length `1`, or
  - Cut it into four ribbons of length `1`.

Your goal is to obtain `k` ribbons of all the **same positive integer length**. You are allowed to throw away any excess ribbon as a result of cutting.

Return *the* **maximum** *possible positive integer length that you can obtain* `k` *ribbons of, or* `0` *if you cannot obtain* `k` *ribbons of the same length*.

Example 1:

```
Input: ribbons = [9,7,5], k = 3
Output: 5
Explanation:
- Cut the first ribbon to two ribbons, one of length 5 and one of length 4.
- Cut the second ribbon to two ribbons, one of length 5 and one of length 2.
- Keep the third ribbon as it is.
Now you have 3 ribbons of length 5.
```

Example 2:

```
Input: ribbons = [7,5,9], k = 4
Output: 4
Explanation:
- Cut the first ribbon to two ribbons, one of length 4 and one of length 3.
- Cut the second ribbon to two ribbons, one of length 4 and one of length 1.
- Cut the third ribbon to three ribbons, two of length 4 and one of length 1.
Now you have 4 ribbons of length 4.
```

Example 3:

```
Input: ribbons = [5,7,9], k = 22
Output: 0
Explanation: You cannot obtain k ribbons of the same positive integer length.
```

Constraints:

- `1 <= ribbons.length <= 10^5`
- `1 <= ribbons[i] <= 10^5`
- `1 <= k <= 10^9`

💡 Hint 1 ⌃

Use binary search on the answer.

💡 Hint 2 ⌃

You can get l/m branches of length m from a branch with length l.
